

# Reuse Techniques

Jan Jancar

# WHY REUSE?

- **Many custom variants are required by the market**
- **Cost savings**
- **Consistent high quality**
- **Improve Time to market**
- **Revalidation & Recertification**
- **Consistency**
- **Scalability**
- **Customer satisfaction**
- **Ability to attract different customers**

# Simple Copy & Paste

Simple technique for using existing data for a new project or product. Good option if reference to the original artifact is not needed.

- Copied artifact will get a **new ID**.
- Ability to copy the links of the copied artifact.
- Ability to copy artifacts from specifications as well as **other components and projects**

## DISADVANTAGES

- Duplication of the data
- No reference to the original data

Widely used technique by companies developing big investment project in military area.

# Copy, Paste & Link

Very similar to Copy & Paste. When copying, link of your choice is created between original and copied artifact.

## ADVANTAGES

- Live reference to the original artifact
- Link validity can be used to spot the changes between artifacts
- Link + Link Validity = Keeping control of the copy

## DISADVANTAGES

- Duplication of the data
- Some systems do not support copying across different data models

Widely used technique in all industries where you need to track the source requirements during your project.

# Artifact based reuse in specification

The best option for preservation high integrity and single source of truth.

- Artifacts can be reused across several specifications
- Any change to the artifacts in any specification is immediately propagated to all instances in other specifications\*

## ADVANTAGES

- Preserving high integrity

## DISADVANTAGES

- Giving up control of the text and attributes = changes are harder to control
- *Links, comments and tags may be specification specific, and their changes may not be propagated to other instances of the artifact in other specifications.*

Example of simple reuse of hardware requirements specification (often medical and automotive projects)

# Attribute based variants

Simple method recommended for less complex use-cases. Each variant has associated its specific attributes. The variant is shown based on saved filter.

## Disadvantage

- Multiplication of attributes
- Traceability – relationship links are usually to general requirement not to specific attribute
- Rich text formatting is generally not possible to use for attributes

Requirements	
Skoda Scala	<b>100</b> Car engine...
	<b>135</b> Gearbox type ...
Skoda Octavia	<b>180</b> Number of gears ..
	<b>300</b> Maximum speed

# Branching & Merging

Key concept in systems and software development. It is possible to branch requirements from a component into 2 or more branches or "streams". Streams can be later compared and/or merged.

Branch is usually created to:

- Create different variants
- Create work stream for experimental work or new features while having stable release stream
- Control the changes and bug fixes
- Enable teams to work in parallel

# Branching & Merging

# Requirements reuse using logical formulas

- Filter relevant artifact using logical formulas entered by user.
- Filtered artifacts are marked and reused in another specification.
- Every artifact is filter based on its own formula – extremely granular.

Contents

▼1 Introduction

The AMR is intended for gathering and reporting of water consumption data to facilitate measurement of residential and business customers.

The system, when deployed, will initially include water service for residential, commercial and industrial customers inside a 72 square mile area (~79,000 meter connections).

The Stakeholder requirements describe the user needs for a water meter reading system (AMR) including the meter, the method of collecting data from the device, and the means by which the customers will be billed for usage.

```

# Reuse across components and projects

- Discover, explore and deliver artifact changes across projects, components and streams
- Cherry pick atomic changes all the way to specific attribute

# Reuse of system components

- Most advanced and most powerful form of reuse across entire engineering lifecycle.
- Component represents physical or logical pieces of the system.
  - In requirements management context, component represent set of requirements specifications and artifacts.
  - In a system context, component represents combination of requirements, architecture and tests, organized in hierarchy
- Components make it easy to reuse and combine parts of the system across V model, into different versions, variants or products.
- Disadvantage – Increased complexity requires certain level of process maturity in your company, regarding variants management
